

Warm your home this winter with efficient natural gas appliances.

Natural Gas Generators

Help provide year-round protection from power outages (automatically turning on when the power goes out and off when power is restored) and connect to your gas line, so no need for fuel storage.

Natural Gas Water Heaters

Cost less to operate, heat water up to twice as fast, and emit up to half the CO₂ greenhouse gases compared to electric models. Most models can operate during power outages, and tankless models offer further savings by only heating water when it's needed.

Natural Gas Furnaces

Provide heat that is up to 25 degrees warmer than electric heat pumps and cost less to operate than electric and propane models.

Natural Gas Space Heaters

Help conserve energy use, and many vent-free units don't require electricity so they work during power outages. Vent-free systems are rated 99.9% efficient, releasing most of the available heat into the room.
